

Individual Work Diary – Project Contribution

Week 1 – Team Formation and Dataset Selection

- The project started when I joined a team with Marek.
- Our team started our analysis work by looking for datasets which we could analyze.
- I proposed the Blinkit Sales dataset as our first choice but Marek wanted to use the Road Accident dataset instead.
- We selected the Road Accident dataset after our team evaluated both datasets through our discussion and received professor feedback.
- The researchers selected this dataset because it included numerous categorical variables which enabled them to conduct advanced analysis and develop significant visual representations.

Week 2 – Technology Selection and Planning

- We discussed which technologies we would use to analyse the dataset.
- We selected different project tools through our analysis of our preferences and our past work experience.
- I selected Power BI as my tool for creating data visualizations and dashboards.
- The team reached a conclusion about how to share the analytical work among the members.

Week 3 – Exploratory Data Analysis (EDA)

- I conducted Exploratory Data Analysis (EDA) to discover how the dataset organized its data elements.
- I examined the data to discover its patterns and trends and distribution patterns.
- The process helped us identify essential variables which created the basis for developing valuable visual representations.

Week 4 – Defining Analysis Focus

- Marek and I discussed different perspectives of analysing the dataset.
- We created two analysis sections to prevent any work duplication between the two of us.
- I spent my time researching accident patterns which showed how current accidents compared to past accidents from the previous year.
- Marek dedicated his research to studying the factors that determine accident severity and the reasons behind severe accidents.

Week 5 – Dashboard Development

- I began creating the Power BI dashboard after finishing my analysis work.
- I developed visualizations which showed accident trend differences between the current year and the previous year.
- The team aimed to deliver insights which readers could easily comprehend through their presentation style.

Week 6 – Evaluation and Improvements

- Our team conducted an appraisal and review session to assess the dashboard performance.
- We evaluated the advantages and disadvantages of our visual representation methods.
- I improved my dashboard based on the feedback I received from others.
- The modifications improved dashboard performance by making it more precise and understandable for users.
